MEMORANDUM FOR THE RECORD

SUBJECT : Mensuration of Small Images

REFERENCE: TEG/PHD Memo for the Record re Subject, Dated 28 October

The following are changes I recommended to [ ] to be incorporated in the referenced memo.

1. At that meeting [ ] inquired why the subject of very small distortion effects due to the possibility of emulsion movement (as differentiated from base distortions) had not been included in the study outline, since this problem area had been a matter of consideration at several previous CCB meetings. [ ] was informed that these effects were not judged to be significant by other NPIC representatives directly involved with Precise Mensuration Study and mensuration operations. [ ] requested time to reconcile this matter.

2. [ ] investigations and developments that would be likely to have the earliest benefit to NPIC mensuration operations. Mr. [ ] believed that the effects he is concerned about may have appreciable limiting effects on the accuracy of measuring small images, however, he agreed that the knowledge to be gained from defining emulsion movement would be less likely to have immediate operational payoff compared to the development of a special DP for mensuration.

3. [ ] was able to talk with [ ] later during the day and is agreed that the [ ] proposal represents a logical area of investigation for [ ] which is also appropriate for CCB support consideration.
